Madina Agénor, ScD will discuss why addressing the influence of sexual orientation on women's health in relation to other dimensions of social inequality is essential to decreasing health inequities and promoting population health. Drawing on her quantitative and qualitative research, Dr. Agénor will discuss how sexual orientation and race/ethnicity simultaneously affect women's health, using cervical cancer screening as a case study. She will show how failing to account for the role of race/ethnicity and racism in shaping sexual orientation disparities in women's health can lead to conclusions that ignore the lived experiences of queer women of color and interventions that fail to meet their needs.
